I

AB The fermentation, isolation, physicochem. properties and biol. activities of asperaldin (I), a new aldose reductase inhibitor, are described. I was produced by Aspergillus niger CFR-1046. The EI-MS spectra of the compound showed mol. ions at m/z 205, based on the mass spectra, and giving a mol. formula of C16H18O5, with the chemical name of 2,6-dihydroxy-8-hexyl-oxy-1,4-naphthaquinone. I exhibited a dose-dependent aldose reductase inhibition at an IC50 of 27 μM.

2003:420474 Document No. 139:226997 Isolation and characterization of two specific regulatory Aspergillus niger mutants shows antagonistic regulation of arabinan and xylan metabolism. de Groot, Marco J. L.; van de Vondervoort, Peter J. I.; de Vries, Ronald P.; van Kuyk, Patricia A.; Ruijter, George J. G.; Visser, Jaap (Section Molecular Genetics of Industrial Micro-organisms, Wageningen University, Wageningen, NL-6703HA, Neth.). Microbiology (Reading, United Kingdom), 149(5), 1183-1191 (English) 2003. CODEN: MROBEO. ISSN: 1350-0872. Publisher: Society for General Microbiology.

AB This paper describes two Aspergillus niger mutants (araA and araB) specifically disturbed in the regulation of the arabinanase system in response to the presence of L-arabinose. Expression of the three known L-arabinose-induced arabinanolytic genes, abfA, abfB and abnA, was substantially decreased or absent in the araA and araB strains compared to the wild-type when incubated in the presence of L-arabinose or L-arabitol. In addition, the intracellular activities of L-arabitol dehydrogenase and L-arabinose reductase, involved in L-arabinose catabolism, were decreased in the araA and araB strains. Finally, the data show that the gene encoding D-xylulose kinase, xkiA, is also under control of the arabinanolytic regulatory system. L-Arabitol, most likely the true inducer of the arabinanolytic and L-arabinose catabolic genes, accumulated to a high intracellular concentration in the araA and araB mutants. This indicates that the decrease of expression of the arabinanolytic genes was not due to lack of inducer accumulation. Therefore, it is proposed that the araA and araB mutations are localized in pos.-acting components of the regulatory system involved in the expression of the arabinanase-encoding genes and the genes encoding the L-arabinose catabolic pathway.

AB An enzyme inhibitor, nigerloxin, with inhibition against soy bean lipoxygenase-I (LOX-1), rat lens **aldose reductase** (RLAR) as well as free radical scavenging activity was isolated from the fermented wheat bran using **Aspergillus niger** CFR-W-105. Its chemical structure was identified as 2-amido-3-hydroxy-6-methoxy-5-methyl-4-(prop-1'-enyl) benzoic acid by NMR and GCEIMS data. The IC50 values against LOX-1 and RLAR were found to be 79 microM and 69 microM and ED50 against 1,1-diphenyl-2-picrylhydrazyl (DPPH) was 66 microM.

L17 ANSWER 5 OF 7 HCAPLUS COPYRIGHT 2004 ACS on STN
1997:628724 Document No. 127:316693 Isolation of Aspergillus niger creA mutants and effects of the mutations on expression of arabinases and L-arabinose catabolic enzymes. Ruijter, George J. G.; Vanhanen, Sipo A.; Gielkens, Marco M. C.; van de Vondervoort, Peter J. I.; Visser, Jaap (Section Molecular Genetics of Industrial Microorganisms, Wageningen Agricultural University, Wageningen, 6703 HA, Neth.). Microbiology (Reading, United Kingdom), 143(9), 2991-2998 (English) 1997. CODEN: MROBEO. ISSN: 1350-0872. Publisher: Society for General Microbiology.
AB Aspergillus niger mutants relieved of carbon repression were isolated from an areA parental strain by selection of colonies that exhibited improved growth on a combination of 4-aminobutanoic acid (GABA) and D-glucose. In addition to derepression of the utilization of GABA as a nitrogen source in the presence of D-glucose, three of the four mutants also showed derepression of L-alanine and L-proline utilization. Transformation of the mutants with the A. niger creA gene, encoding the repressor protein CREA, re-established the areA phenotype on GABA/D-glucose, identifying the mutations as creAd. The creA gene mapped on chromosome IV by linkage anal. and contour-clamped homogeneous elec. field hybridization. The creA mutants obtained were used to study the involvement of CREA in repression by D-glucose of arabinases and L-arabinose catabolism in A. niger. In wild-type A. niger, α-L-arabinofuranosidase A, α-L-arabinofuranosidase B, endo-arabinase, L-arabinose reductase and L-arabitol dehydrogenase were induced on L-arabinose, but addition of D-glucose prevented this induction. Repression was relieved to varying degrees in the creA mutants, showing that biosynthesis of arabinases and L-arabinose catabolic enzymes is under control of CREA.

L17 ANSWER 6 OF 7 HCAPLUS COPYRIGHT 2004 ACS on STN
1993:187567 Document No. 118:187567 Induction of extracellular arabinases on monomeric substrates in Aspergillus niger. Van der Veen, Peter; Flipphi, Michel J. A.; Voragen, Alphons G. J.; Visser, Jaap (Dep. Genet., Agric. Univ., Wageningen, 6703 HA, Neth.). Archives of Microbiology, 159(1), 66-71 (English) 1993. CODEN: AMICCW. ISSN: 0302-8933.
AB The induction of extracellular arabinases by pentose sugars and polyols generated by the metabolic pathway of L-arabinose and D-xylose catabolism

Searched by: Mary Hale 571-272-2507 REM 1D86

in Aspergillus niger was investigated. Induction occurred with L-arabinose and L-arabitol but not with D-xylose or xylitol. L-Arabitol, in particular, was found to be a good inducer for α-L-arabinofuranosidase and endo-arabinose activities. Western blotting anal. showed both α-L-arabinofuranosidase A and B to be present. No induction was observed using D-arabitol. Unlike the wild-type A. niger N402 strain, the A. niger xylulose kinase-neg. mutant N572 also showed induction of α-L-arabinofuranosidases A and B and endo-arabinose activity on D-xylose and xylitol. This is due to metabolic conversion of these compds. leading to the accumulation of both xylitol and L-arabitol in this mutant, the latter of which then acts as inducer. The induction of the two α-L-arabinofuranosidases and endo-arabinase is under the control of two regulatory systems, namely pathway specific induction and carbon catabolite repression. Under derepressing conditions in the wild type, only a α-L-arabinofuranosidase B could be detected by Western blotting anal. This indicates that α-L-arabinofuranosidase B is of importance in the initiation of specific induction of the various arabinose activities in A. niger grown on arabinose-containing structural polysaccharides.

L17 ANSWER 7 OF 7 HCAPLUS COPYRIGHT 2004 ACS on STN
1989:591175 Document No. 111:191175 L-Arabinose and D-xylose catabolism in Aspergillus niger. Witteveen, C. F. B.; Busink, R.; Van de Vonderboort, P.; Dijkema, C.; Swart, K.; Visser, J. (Dep. Genet., Agric. Univ., Wageningen, 6703 HA, Neth.). Journal of General Microbiology, 135(8), 2163-71 (English) 1989. CODEN: JGMIAN. ISSN: 0022-1287.

AB A mutant of A. niger unable to grow on D-xylose and L-arabinose was isolated. Genetic anal. revealed that the mutation is located on linkage group IV. Enzymic anal. revealed a deficiency in D-xylulose kinase activity. After transfer of growing mycelium to a medium containing either D-xylose or L-arabinose, the mutant accumulates large amts. of arabitol and xylitol, as shown by 13C NMR spectroscopy. These data and an anal. of enzyme activities induced by D-xylose and L-arabinose in the wild-type strain led to the following catabolic pathway for D-xylose: D-xylose-xylitol-D-xylulose-D-xylulose 5-phosphate; and for L-arabinose: L-arabinose-L-arabitol-L-xylulose-xylitol-D-xylulose-D-xylulose 5-phosphate. The reduction steps of the sugars to the corresponding polyols are all NADPH dependent. The oxidation steps of the polyols to the sugars are all NAD+ dependent. Fractionation of cell-free exts. gave information about the specificity of the enzymes and showed that all the reactions are catalyzed by different enzymes.

L47 ANSWER 1 OF 2 HCAPLUS COPYRIGHT 2004 ACS on STN
1982:2847 Document No. 96:2847 Pig brain aldose reductase: a kinetic study using the centrifugal fast analyzer. Boghosian, Robert A.; McGuinness, Eugene T. (Dep. Chem., Seton Hall Univ., South Orange, NJ, 07079, USA). International Journal of Biochemistry, 13(8), 909-14 (English) **1981**. CODEN: IJBOBV. ISSN: 0020-711X.
AB Initial velocity and product **inhibition** studies of pig brain aldose reductase (**EC 1.1**.1.21) previously purified to apparent homogeneity, using D-xylose as substrate, indicated a sequential mechanism, probably with an ordered bi bi or an iso Theorell-Chance pattern of substrate **addition-product** release. The Km values for xylose and NADPH were 4.1 mM and 3.1 μM, resp. The advantages of using the centrifugal fast analyzer for reaction rate studies with enzymes, e.g. simultaneous multiple-reaction initiation and parallel monitoring, are discussed.

1979:485923 Document No. 91:85923 The reaction of carbonyl cyanide phenylhydrazones with thiols. Drobnica, L.; Sturdik, E. (Dep. Microbiol. Biochem., Slovak Polytech. Univ., Bratislava, 880 37, Czech.). Biochimica et Biophysica Acta, 585(3), 462-76 (English) **1979**. CODEN: BBACAQ. ISSN: 0006-3002.

AB Carbonyl cyanide phenylhydrazone and its ring-substituted analogs reacted with thiols (thioglycolic acid, 2-mercaptoethanol, dithiothreitol) and aminothiols (cysteine, glutathione) to give the corresponding N-(substituted phenyl)-N'-(alkylthiodicyano)-methylhydrazine derivs. These **addition products** decomposed to the original components in alkaline solution In the presence of excess thiol in aqueous buffered systems, the addition reactions are practically quant. with respect to phenylhydrazone, follow pseudo-1st-order kinetics, and can be investigated spectrophotometrically. These reactions are of the bimol. AdN type where the nondissocd. forms of carbonyl cyanide phenylhydrazones function as electrophilic components and the RS- ion is the nucleophilic component (attack of the azomethine group). The reactivity of carbonyl cyanide phenylhydrazones with respect to thiols increases in the order carbonyl cyanide phenylhydrazone < carbonyl cyanide m-chlorophenylhydrazone < carbonyl cyanide p-trifluoromethoxyphenylhydrazone, which corresponds to the decreasing order of their pKa values. On the other hand, the reactivity of the thiols increases with their basicity. The reactivity of carbonyl cyanide phenylhydrazone with thiols is comparable to the reactivity of Ph isothiocyanate and N-ethylmaleimide. Carbonyl cyanide phenylhydrazone was an efficient **inhibitor** of rabbit muscle glyceraldehyde 3-phosphate dehydrogenase (**EC 1.2**.1.12). The results are discussed in relation to the biol. activity of carbonyl cyanide phenylhydrazones.
